43% of Chronic Kidney Disease patients showed improvement.

A study compares 21 patients with advanced stages (3A and worse) of Chronic Kidney Disease (CKD), before and after receiving Well Cell's patented PIR® treatment over time ranging from 3 to 30 months.

Before the study began, only 4.76% of the 21 patients were improving, and at the end of the study period, 42.86% showed improvement!

Importantly, **NONE** of the patients progressed to dialysis—which costs Medicare about \$100,000 a year per patient!

These results have led Well Cell to plan rigorous prospective studies to further document the effects of Physiologic Insulin Resensitization®.
